3-SAT

Let us repeat what we had done for 2-SAT to 3-SAT.

3-SAT Algorithm:

- 1. Start with an arbitrary truth assignment. \sim Say S
- **2.** Repeat up to m times, terminating if all clauses are satisfied:
 - (a) Choose an arbitrary clause that is not satisfied.
 - (b) Choose one of the literals uniformly at random, and change the value of the variable in the current truth assignment.
- 3. If a valid truth assignment has been found, return it.
- 4. Otherwise, return that the formula is unsatisfiable.

A: = Truth assignment at tome i/stepi.

As before let X_i be the r.v that denotes the mo. of vars having the same value in A_i and s.

$$\Pr\left[\begin{array}{c} X_{i+1}=1 \ | \ X_i=0 \end{array}\right] = 1.$$

$$\Pr\left[\begin{array}{c} X_{i+1}=1 \ | \ X_i=j \end{array}\right] \Rightarrow \frac{1}{3}$$

$$\Pr\left[\begin{array}{c} X_{i+1}=j+1 \ | \ X_i=j \end{array}\right] \leq \frac{2}{3}$$

$$\Pr\left[\begin{array}{c} X_{i+1}=j-1 \ | \ X_i=j \end{array}\right] \leq \frac{2}{3}$$

Let Yo = Xo, Y1, ... be the "pessimbstic version" of r.vs Xo, X1, ... Such that

$$\begin{cases} P_{r} \left[Y_{i+1} = j+1 \middle| Y_{i} = j \right] = \frac{1}{3} \\ P_{r} \left[Y_{i+1} = j-1 \middle| Y_{i} = j \right] = \frac{2}{3} \end{cases}$$

Recall that
$$h_n=0$$
 and $h_0=h_1+1$. Further, $1 \le j \le n-1$

$$E[Z_i] = \frac{1}{3}(1+E[Z_{i+1}]) + \frac{2}{3}(1+E[Z_{i-1}]) \xrightarrow{Z_{i-1}}^{V_3} 1+Z_{i+1}$$

$$\Rightarrow h_j = \underbrace{h_{j+1}}_{3} + \underbrace{2 \cdot h_{j-1}}_{3} + 1 \cdot \underbrace{h_j}_{1} = \underbrace{2^{n+2}}_{2^{n-2}} - \underbrace{2^{n-2}}_{2^{n-1}}^{2} - 3(n-j)$$
is a unsigne solution.

Note that $h_j = \Theta(2^n)$. "Almost searching the ushale solution space".

(\frac{4}{3})^n \cdot n^{01})

Qn: What if we start w/ an assignment chosen unbformly at randow?

Modified 3-SAT Algorithm:

- 1. Repeat up to m times, terminating if all clauses are satisfied:
 - (a) Start with a truth assignment chosen uniformly at random.
 - (b) Repeat the following up to 3n times, terminating if a satisfying assignment is found:
 - i. Choose an arbitrary clause that is not satisfied.
 - ii. Choose one of the literals uniformly at random, and change the value of the variable in the current truth assignment.
- **2.** If a valid truth assignment has been found, return it.
- 3. Otherwise, return that the formula is unsatisfiable.

Let q, be the probothat we reach the satisfying assign-ment in < 3n steps starting w/ an assignment chosen unbformly at random.

Q; is the lower bound on prob that we reach S stanking from an assignment that disagness w/ S in j locations.

Consider a particle moving on an integer line, w.p. of moving up and w/p of moving down by 1.

Pr[Exactly le moves down and letj moves up in j+2le]

$$= \left(\frac{j+2k}{k}\right) \left(\frac{2}{3}\right)^{k} \left(\frac{1}{3}\right)^{k+j}$$

Strling's approx.

Verim (m) & m! < 2 Verim (m) m

Therefore, Prob of reaching a sat assgn with in j+2k < 3n steps, starting from an assignment that disagness noth S in j locations is as follows.

$$Q_{j} > \max_{k=0,\dots,j} \left\{ \begin{pmatrix} \frac{1}{4} & \frac{2}{4} \\ \frac{1}{4} & \frac{2}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{3} & \frac{1}{4} \\ \frac{1}{3} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{3} & \frac{1}{4} \\ \frac{1}{3} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} & \frac{1}{4} \end{pmatrix} + \frac{2}{27^{j}} \begin{pmatrix} \frac{1}{4} & \frac{1}{4} & \frac{1}$$

$$\approx \frac{C}{\sqrt{j}} \cdot \frac{1}{2^{j}}$$
 where $C = \frac{\sqrt{3}}{8\sqrt{n}} \approx 0.1222...$

$$\geqslant \frac{1}{2^{n}} + \sum_{j=1}^{n} {\binom{n}{j}} \left(\frac{1}{2}\right)^{n} \cdot \frac{c}{J_{\delta}^{2}} \cdot \frac{1}{2^{\delta}}$$

$$= \frac{C}{\sqrt{n}} \left(\frac{1}{2}\right)^{N} \cdot \left(\frac{3}{2}\right)^{N} \cdot \left(\frac{3}{2}\right)^{N}$$

$$= \frac{C}{\sqrt{N}} \cdot \left(\frac{3}{4}\right)^{N}.$$

Prob of finding a solution in 3n steps $\Rightarrow \frac{C}{5\pi} \left(\frac{3}{4}\right)^n$.

and total no. of steps needed $\leq \left(\frac{4}{3}\right)^n \cdot \frac{\sqrt{n}}{c} \cdot 3n$.

$$= 0 \left(\frac{3}{3} \right)^{\frac{1}{C}} \cdot \frac{3}{3} \cdot \frac{2}{1.33} \cdot \frac{2}{3} \cdot \frac{3}{3} \cdot \frac{2}{3} \cdot \frac{3}{3} \cdot \frac$$

Repeat this r times to boost the probability to a value close to 1.

$$\Rightarrow$$
 $\mathcal{M} \approx O\left(\sqrt{3/2} \cdot r \cdot \left(\frac{4}{3}\right)^{\mathsf{N}}\right)$
